WALL & BUILDING ATTACHMENTS

Arizon's air structures can be incorporated into your organization's current facility space by attaching to existing 'conventional' buildings. Our engineers can design your structure to be fitted to a rooftop, clubhouse, brick-and-mortar building, or wall space to integrate your new dome to the space you already have.

ATTACHMENTS TO OTHER STRUCTURES

Air structures can be attached other buildings in a variety of ways, and the design interface often depends on the planned use and size of interface required. A structural connection to a building requires that the other building takes the uplift load that the air structure will develop. Arizon can calculate the design loads required of the building. This is often the type of connection when attaching the air structure to the side of a clubhouse.

AN EXTENSION OF CURRENT FACILITY SPACE, PERMANENTLY OR SEASONALLY

Building attachments are perfect for expanding your business, or for seasons where you've got a lot of inventory or need additional office and retail space, Arizon's domes have the flexibility to add climate-controlled, structurally-sound, clear-span space to your facility both quickly and affordably. For approximately 1/10 of the cost of building a conventional brick-and-mortar structure, add locker rooms, classrooms, a welcome center, concession stands, meeting rooms, event space, offices, reception areas, a weight room or extra storage space on to or connected to your building.
